

# Anti-Thrombotic Drugs

PHARMACOLOGY

DR HUNG DIEP

# Overview

- ▶ Anti-thrombotic drugs include:
  - ▶ Anticoagulants
  - ▶ Fibrinolytics
  - ▶ Antiplatelets

# Anticoagulants

- ▶ Interrupt the coagulation pathway to prevent clot formation
- ▶ Types include:
  - ▶ Indirect thrombin inhibitors
  - ▶ Vitamin K antagonists
  - ▶ Direct Factor Xa inhibitors
  - ▶ Direct thrombin inhibitors

# Indirect Thrombin Inhibitors

- ▶ Anti-thrombotic effect is exerted by interaction with anti-thrombin
- ▶ Bind to anti-thrombin, which is a plasma protein that prevents the action of thrombin
  - ▶ Ultimately stops the conversion of fibrinogen to fibrin
- ▶ Includes:
  - ▶ Unfractionated heparin
  - ▶ Low molecular weight heparin
  - ▶ Fondaparinux

# Unfractionated Heparin

- ▶ Binds to anti-thrombin III
  - ▶ Inhibits clotting factor proteases including Factors IIa, IXa, Xa
- ▶ No fibrinolytic activity
- ▶ Effect is monitored by Activated Thromboplastin Time
- ▶ Increases aldosterone production
- ▶ Reversal agent is protamine sulphate

# Pharmacokinetics

- ▶ A: parenteral only (IV, SC)
- ▶ D: high protein binding
- ▶ M: liver and reticuloendothelial system metabolism
- ▶ E: metabolites excreted in urine

# Indications

- ▶ Prevention/treatment of VTE
- ▶ Acute coronary syndrome
- ▶ Arterial thromboemboli
- ▶ Disseminated intravascular coagulopathy

# Adverse Effects

- ▶ Bleeding
- ▶ Allergy
- ▶ Reversible alopecia
- ▶ Osteoporosis and fractures
- ▶ Heparin-induced thrombocytopenia
  - ▶ Occurs due to antibodies against heparin and platelet factor 4 compound
  - ▶ Usually an IgG compound so takes at least 5 days to form
  - ▶ Occurs in 1-4% of patients treated with unfractionated heparin for a minimum of 7 days
    - ▶ Rates lower with LMWH
  - ▶ Treated by cessation of heparin and use of direct thrombin inhibitors (e.g. bivalirudin)

# Low-Molecular Weight Heparin

- ▶ Binds to anti-thrombin III to facilitate inactivation of Factor Xa
- ▶ Similar efficacy to unfractionated heparin
- ▶ No fibrinolysis
- ▶ No method of monitoring
- ▶ Poor efficacy of protamine in reversal

# Pharmacokinetics

- ▶ A: subcutaneous only (90% bioavailability)
- ▶ D: high protein binding
- ▶ M: slight hepatic metabolism
- ▶ E: renal excretion

# Indications

- ▶ Prevention/treatment VTE
- ▶ Acute coronary syndrome
- ▶ Arterial thromboemboli

# Adverse Effects

- ▶ Bleeding
- ▶ Allergy
- ▶ Heparin-induced thrombocytopenia
  - ▶ Lower risk compared to unfractionated heparin

# Vitamin K Antagonists

- ▶ Warfarin inhibits vitamin K epoxide reductase
- ▶ Decreases carboxylation of Factors II, VII, IX, X, and protein C and S
- ▶ There is an 8-12h delay in anticoagulant action due to depletion of protein C
- ▶ Effect can be monitored via the Prothrombin Time/INR

# Pharmacokinetics

## ▶ Warfarin

- ▶ A: oral (100% bioavailability)
- ▶ D: 99% protein bound, small Vd
- ▶ M: hepatic metabolism into inactive products by CYP450 enzymes
- ▶ E: metabolites excreted in bile and urine

# Indications

- ▶ Prevention/treatment of VTE
- ▶ Prevention of thromboembolism with prosthetic heart valves
- ▶ Prevention of stroke in those with increased embolic risk

# Adverse Effects

- ▶ Bleeding
- ▶ Hepatic dysfunction
- ▶ Multiple interactions with other drugs
  - ▶ Particularly P450 CYP2C9 inducers or inhibitors

# Direct Factor Xa Inhibitors

- ▶ Inhibits downstream activation of prothrombin
- ▶ Increases Prothrombin Time/INR
- ▶ Lower bleeding rates compared to Warfarin
- ▶ No need for monitoring of therapeutic action provided renal function is stable

# Pharmacokinetics

- ▶ Rivaroxaban
  - ▶ A: oral, high bioavailability
  - ▶ D: high protein binding, moderate Vd
  - ▶ M: 2/3 hepatic metabolism
  - ▶ E: 1/3 excreted unchanged in the urine; metabolites excreted renally and faecally

# Indications

- ▶ Prevention of stroke in AF
- ▶ Prevention/treatment of VTE
- ▶ Treatment of pulmonary embolism

# Adverse Effects

- ▶ Bleeding
- ▶ Peripheral oedema
- ▶ Muscle spasm
- ▶ Hepatotoxicity

# Direct Thrombin Inhibitors

- ▶ Exert their anticoagulant effect by directly binding to the active site of thrombin
  - ▶ Prevents subsequent activation of fibrinogen to fibrin
- ▶ Includes Dabigatran, Bivalirudin
  - ▶ Dabigatran is absorbed as a prodrug (dabigatran etexilate), which is then converted into the active form

# Pharmacokinetics

- ▶ Dabigatran
  - ▶ A: oral, with rapid absorption and metabolism of the prodrug into its active form
  - ▶ D: moderate  $V_d$
  - ▶ M: hepatic metabolism into its active form, minimal metabolism of the active for itself
  - ▶ E: urinary excretion in its active form

# Indications

- ▶ Prevention/treatment of VTE
- ▶ Non-valvular AF

# Adverse Effects

- ▶ Bleeding
  - ▶ Particularly gastrointestinal bleeding
- ▶ Gastritis

# Fibrinolytics

- ▶ Preferentially activates plasminogen
  - ▶ Plasminogen is bound to fibrin
- ▶ Active plasmin results in breakdown of fibrin clots
- ▶ Plasmin naturally aims to confine fibrinolysis to the formed thrombus and avoid systemic activation
- ▶ Includes: alteplase, tenectapase

# Fibrinolytics

# Pharmacokinetics

- ▶ Tissue Plasminogen Activator (t-PA)
  - ▶ A: IV
  - ▶ D: low Vd
  - ▶ M: hepatic metabolism
  - ▶ E: hepatically cleared

# Indications

- ▶ Acute STEMI
- ▶ Massive pulmonary embolism
- ▶ Acute ischaemic stroke
- ▶ Acute VTE with haemodynamic instability

# Adverse Effects

- ▶ Bleeding
- ▶ Allergy

# Antiplatelets

- ▶ Platelet function is regulated by three categories of substances
  - ▶ Agents generated within the platelet that act within the platelet (thromboxane A<sub>2</sub>)
  - ▶ Agents generated within the platelet that interact with membrane receptors (ADP, prostaglandin)
  - ▶ Agents generated outside the platelet that interact with the platelet membrane

# Thromboxane A2 Inhibitor

- ▶ Aspirin is rapidly converted into salicylic acid
- ▶ Irreversible COX inhibitor
  - ▶ COX-1 is responsible for TxA2 production, which is a mediator of platelet aggregation and vasoconstriction
  - ▶ COX-2 is responsible for inflammation and cancer
- ▶ Results in decreased platelet aggregation
- ▶ Low dose aspirin preferentially blocks COX-1

# Pharmacokinetics

- ▶ Aspirin
  - ▶ A: oral, high bioavailability
  - ▶ D: salicylate 80-90% protein bound
  - ▶ M: converted to salicylic acid in the gastrointestinal mucosa and liver
  - ▶ E: renal
    - ▶ Effects of aspirin last for the life of the platelet

# Indications

- ▶ Acute coronary syndrome
- ▶ Atherosclerosis
- ▶ Inflammation
- ▶ Prevention of recurrent ischaemic stroke and TIA
- ▶ Prevention of pre-eclampsia

# Adverse Effects

- ▶ Gastrointestinal irritation
- ▶ Bleeding
- ▶ Bronchospasm
- ▶ Angioedema

# Phosphodiesterase Inhibitor

- ▶ Dipyridamole is a phosphodiesterase inhibitor
- ▶ Increases platelet cAMP and cGMP activity
- ▶ Results in inhibition of platelet function (adhesion and aggregation)
- ▶ Only effective in combination with Aspirin

# Pharmacokinetics

- ▶ Dipyridamole
  - ▶ A: oral (70% bioavailability)
  - ▶ D: large Vd, 97-99% protein bound
  - ▶ M: liver
  - ▶ E: bile

# Indications

- ▶ Prevention of recurrent ischaemic stroke and TIA

# Thienopyridines

- ▶ Clopidogrel is a prodrug that is rapidly metabolised into its active form
- ▶ Irreversibly binds to platelet P2Y<sub>12</sub> (ADP) receptor
- ▶ Inhibits platelet aggregation for the life of the platelet
- ▶ Inhibits amplification of platelet activation

# Pharmacokinetics

- ▶ Clopidogrel
  - ▶ A: oral, rapid
  - ▶ D: 94-98% protein bound
  - ▶ M: hepatic into active form
  - ▶ E: urine and faeces
    - ▶ Effect lasts for the life of the platelet

# Indications

- ▶ Acute coronary syndrome
- ▶ Atherosclerosis

# Adverse Effects

- ▶ Bleeding
- ▶ Skin reactions
- ▶ Gastrointestinal ulcer
- ▶ Pancytopenia
